

# How to Add a Spam Filter to Opt-In Forms

You can block domains from submitting web forms. This is particularly useful if someone keeps filling out your form and reporting your email as spam; this type of malicious intent is not common, but can happen.

**Please Note!** This feature applies to both external web forms and internal forms

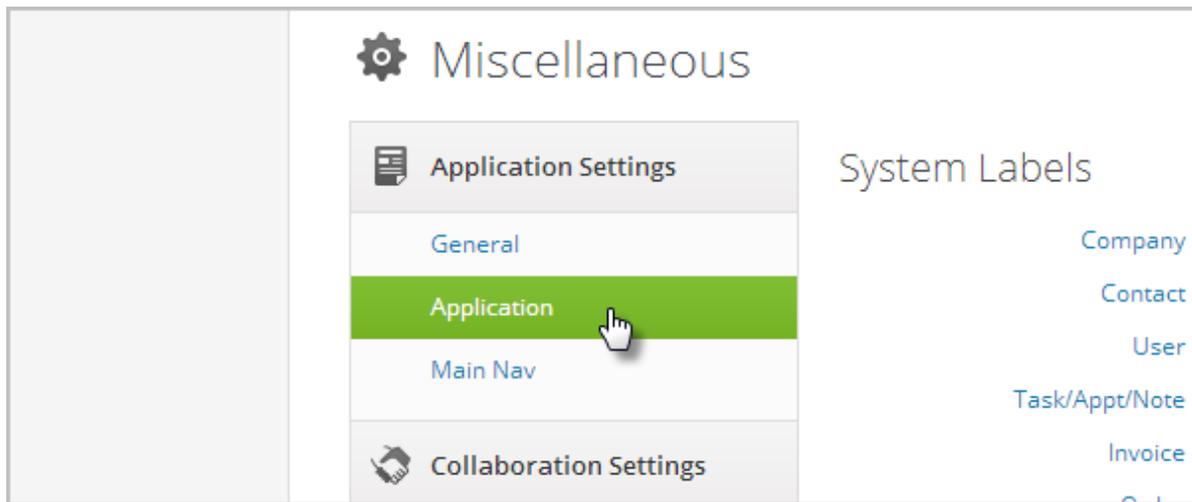

**Please Note!** When blocking specific email addresses, for example, *david@xbsuinessprofs.com*, and no one else on that domain, entering *david@xbsuinessprofs.com* will not work. You must enter david as a line item in the Spam Filter and note that *any* email address with david before or after the @ sign will also be blocked!

**Protip!** The spam filter is a global setting that applies to **all** of the web forms you create. If a blocked domain is entered into the form, the person submitting the form will see the blow error message (Error 7726)

The screenshot shows a web form with two input fields: 'First Name \*' containing 'David' and 'Email \*' containing 'dave@xbsuinessprofs.net'. Below the fields is a 'Submit' button. A white error message box is overlaid on the form, stating 'There was 1 error:' followed by a red bullet point and 'Error 7726'.

1. Navigate to **Admin > Settings > Application Tab**

2. Go to **Form Security**
3. Enter domain name(s) you wish to block. For example, to block any email address ending with the domain, "xbusinessprofs.net", just type, *xbusinessprofs* into the SPAM filter. To add multiple domains, just enter the new domain on a new line in the SPAM filter.
