

Campaign Sequence - HTTP Post🔗

An HTTP Post is used to send information from Infusionsoft to a web page that runs a script (e.g., ASP, PHP, Javascript.) which extracts data from the URL and processes it on your web server.

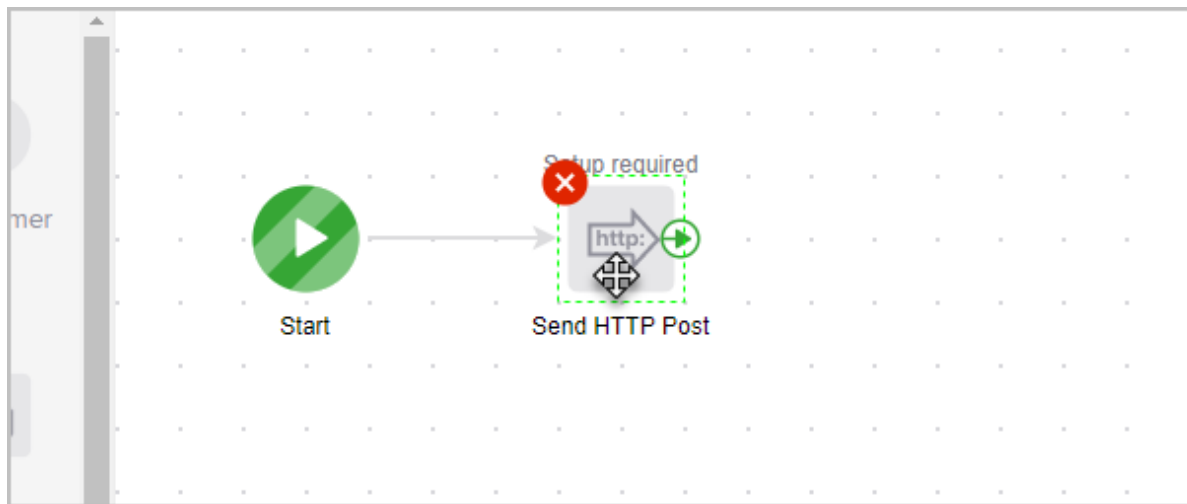

Please Note! Only standard port numbers are supported. Supported ports are: 80 and 443.

Each HTTP post object must be configured individually. They cannot be re-used in multiple sequences or at more than one point in the same sequence. HTTP post objects are not archived. If you delete an HTTP Post object from a sequence, it can only be restored if you restore a previous version of the entire campaign.

1. Double-click on the campaign sequence you wish to edit or create a new campaign sequence.
2. Drag and drop a **Send HTTP Post** object onto the canvas.

3. Double-click on it to configure the post settings.

4. Enter the post URL. This is where the external web server script is hosted.

5. Click **Merge** to access the Infusionsoft fields you can post.
Each line item of the HTTP Post will send 2 pieces of information to the URL: a field *name* and a field *value*.
- Name: The field name can be defined by you. This flexibility allows you to use existing scripts and / or comply with external API standards. If there is no need to comply with external standards, you may use the default Infusionsoft field names for standard or custom fields.
 - Value: The value is the content of the field. For example, the standard field named "Email" might have the value "myemail@email.com." You must use an Infusionsoft merge field to designate the value to be pulled.
6. You can add multiple lines of Name / Value pairs.

The screenshot shows a configuration window with a list of Name/Value pairs. The first pair is "Contact.FirstName". To the right of the list are minus and plus icons. A "Merge" button is located at the top right of the window.

- Click the "plus" icon to add another pair
- Click the "minus" icon to remove a pair

- Note: You cannot reorder the lines after they've been added. You can only delete and recreate them. Click on to remove a Name / Value line item.*
- When you've finished adding Name / Value lines, click on the **Test** button to verify the post is working as expected. A "200" response code validates the post is working properly. [Other response codes](#) may require troubleshooting.

9. Set it **Ready**

The screenshot shows the configuration window with the "Ready" toggle switch turned on (blue). The "Test" and "Actions" buttons are visible at the top. The text "Saved at 10:38 AM" is displayed on the left.

- You are ready to publish your changes.
